

ALL-IN-ONE IP PBX SYSTEM FOR SMALL BUSINESSES

The IPcts AT4 card provides four analogue PSTN trunk line ports to interface to a Service Provider's analogue telephone lines. It has four physical RJ11 interfaces enabling simple installation into the IPcts system application.

Installation is easily carried out in an existing or new IPcts application as the AT4 card is simply inserted into the 'Options Card' slot(s) on the front of the IPcts system. It is automatically detected and loaded with the software needed to run it. An engineer can then program the card either locally or remotely with the required configuration as per the customers needs.

The AT4 card has been designed to interface and work in all countries around the world with 'strap-able' interfaces to ensure the correct electrical conditions are provided or detected by the AT4 card, which in turn ensures the correct operation of the AT4 card on any analogue line. The AT4 card also 'records' the signalling supplied by the PTT to ensure correct ringing and clear down operation.

Features:

- 4 analogue ports per AT4 card
- Strap-able interfaces
- Hot pluggable
- Auto upload of software
- Auto detects line signalling & line conditions
- Web Browser Configurable
- Installed into IPcts systems 'Option Card' slot (on the front of the system)
- Space for 2 x AT4 cards providing up to 8 analogue trunk lines.
- RJ11 connectors
